

LOCOLINC[®], the logical choice for command control.

LOCOLINC[®] was designed from the beginning – and still is today – the most comprehensive control system available to model railroaders. LOCOLINC offers complete control of locomotives and layout accessories with lifelike realism. Plus it's easy and cost-effective to install and expand.

LOCOLINC puts you in control fast. It's as easy as installing LOCOLINC receivers in locomotives, at turnouts, and at any other layout features you want to control. There's no need for cumbersome, expensive wiring and bus schemes because LOCOLINC does not use the rails to transmit control signals. And there are no umbilical cords to limit your freedom as you move around the layout controlling each element. For hobbyists who can take advantage of battery power, only LOCOLINC wireless addressable control offers that choice!

LOCOLINC gives you prototypical control realism. When it comes to realistic railroad operation, LOCOLINC is the only control system that really does the job. M-U engines for extra power over passes and mountain grades with realistic simplicity, just like the big boys. Synchronize the speed of individual locomotives so that each moves at the same speed within an MUed locomotive string. With LOCOLINC's precise incremental speed control is so responsive trains just creep along at the slowest speed settings.

LOCOLINC automatically manages directional lighting. On MUed trains, only the head lamp of the first leading

direction locomotive is lit, all other units remain dark. More, locomotive bells and whistles are controlled **real time** from the hand-held transmitter. Blow the whistle or sound the bell when you want, where you want, for as long as you want.

Throw turnouts as you go. To simulate routed approaches and departures from yards and train stations, use the exclusive "dispatcher switching" capability to throw a series of switches with a single command. There's a LOCOLINC accessory receiver

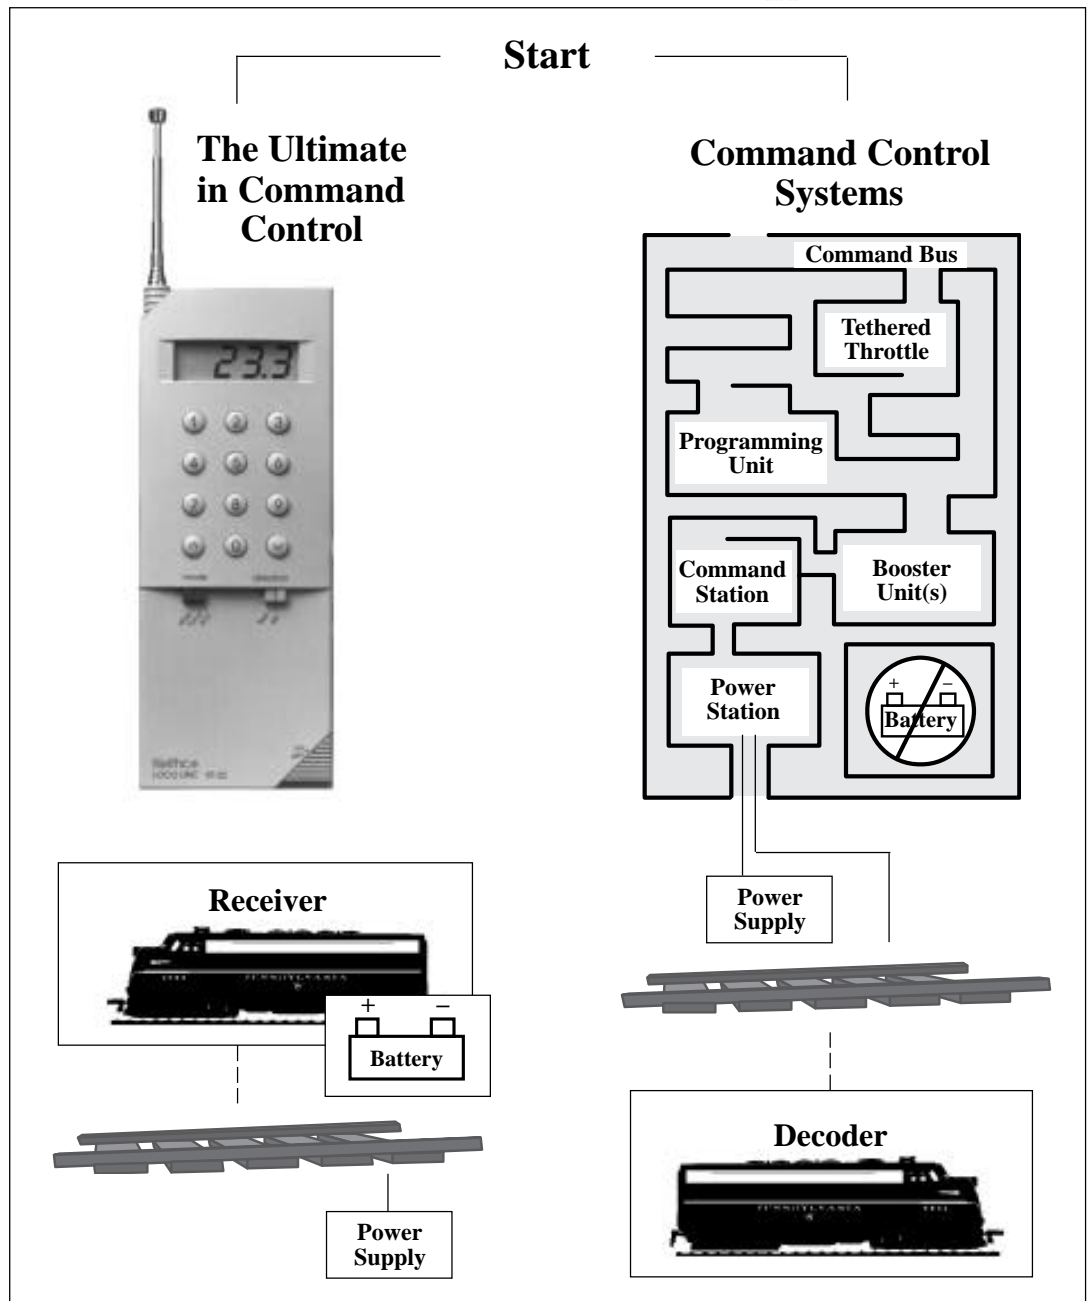

to control every motorized or electrical feature on your layout.

LOCOLINC is for everyone. LOCOLINC wireless addressable control systems bring a whole new level of hobby enjoyment. Economical starter packages get you going. Additional elements can be purchased individually and in multi-paks. Transmitters work across all scales N through G. Locomotive receivers are available in 1-, 2- and 5-Amp current ratings and for twin servo control (live steam).

Join the ranks of model railroaders who have discovered LOCOLINC – the ultimate in digital command control. See why we say . . .

"Model railroading has never been so much fun! Model railroading has never been so realistic!"
